

REKOLT Planters' Cooperative Produce Tracker

Design -v2

This updates the design-v1.pdf class diagram to reflect the code as I actually implemented it ... contains full reasoning for each change is in docs/design/change-log.md. In short: three service classes (ProduceCatalog, PaymentService, ReportWriterService) were added. Delivery's grade field changed from String to the Grade enum. SeasonReport is now implemented, aggregating Members and feeding ReportWriterService. SeasonReport is now implemented, aggregating Members and feeding ReportWriterService.

Notes:

- Solid arrow, empty triangle: inheritance (**CerealProduce**, **PerishableProduce**, **CashCropProduce** extend **Produce**).
- Solid arrow, open head: association (**Delivery** uses one **Produce** and one **Grade**).
- Filled diamond: composition (a **Member**'s deliveries belong solely to that **Member**).
- Empty diamond: aggregation (**SeasonReport** aggregates **Members**, which exist independently).
- Dashed arrow, empty triangle: interface realisation (**Delivery** and **Member** each implement **Payable** and **Reportable**).
- Dotted arrow: a service class using or building instances of a model class, not owning them.
